

Duration and latency observation pack

Separate event-time and cue-to-onset records; state the valid window and missing observations. therapycrm.io

Duration: define before timing

Observable event / examples / exclusions

Onset and offset rules / unit

Planned window / actual valid observation time

Observed episodes

Episode	Start	Stop	Duration + unit	Status / interruption / support

Total nonoverlapping observed duration / valid observed time

Incomplete episodes / missed coverage / review decision

Latency: cue to response onset

Defined cue and response onset / unit

Observation limit / additional prompt rule

Opportunities: use explicit response and observation status

Reference	Cue / time	Onset / value	Limit	Status / support / context

Response observed, no response within limit, declined before opportunity, and not observed are distinct. Leave exact latency blank when onset was not observed; do not replace a limit or missing record with zero.

Observed response summary / valid denominator

No-response limits / missing records / clinician review
